Evidence on the molecular basis of the <i>Ac/ac</i> adaptive cyanogenesis polymorphism in white clover ( <i>Trifolium repens</i> L). (2008) ( <a href="https://pubmed.ncbi.nlm.nih.gov/18458107">https://pubmed.ncbi.nlm.nih.gov/18458107</a> )	Main Reference
Olsen KM; Hsu SC; Small LL	Authors
White clover is polymorphic for cyanogenesis, with both cyanogenic and acyanogenic plants occurring in nature. This chemical defense polymorphism is one of the longest-studied and best-documented examples of an adaptive polymorphism in plants. It is controlled by two independently segregating genes: <i>Ac/ac</i> controls the presence/absence of cyanogenic glucosides; and <i>Li/li</i> controls the presence/absence of their hydrolyzing enzyme, linamarase. Whereas <i>Li</i> is well characterized at the molecular level, <i>Ac</i> has remained unidentified. Here we report evidence that <i>Ac</i> corresponds to a gene encoding a cytochrome P450 of the CYP79D protein subfamily (CYP79D15), and we describe the apparent molecular basis of the <i>Ac/ac</i> polymorphism. CYP79D orthologs catalyze the first step in cyanogenic glucoside biosynthesis in other cyanogenic plant species. In white clover, Southern hybridizations indicate that CYP79D15 occurs as a single-copy gene in cyanogenic plants but is absent from the genomes of <i>ac</i> plants. Gene-expression analyses by RT-PCR corroborate this finding. This apparent molecular basis of the <i>Ac/ac</i> polymorphism parallels our previous findings for the <i>Li/li</i> polymorphism, which also arises through the presence/absence of a single-copy gene. The nature of these polymorphisms may reflect white clover's evolutionary origin as an allotetraploid derived from cyanogenic and acyanogenic diploid progenitors.	Abstract
Recurrent gene deletions and the evolution of adaptive cyanogenesis polymorphisms in white clover ( <i>Trifolium repens</i> L.). (2013) ( <a href="https://pubmed.ncbi.nlm.nih.gov/22694056">https://pubmed.ncbi.nlm.nih.gov/22694056</a> )	Additional References
